Abstract

Background

Vaccination coverage rates for older adults are low. To better understand utilization of Medicare vaccination benefits we examined a retrospective cohort of more than 26 million Medicare fee-for-service beneficiaries age 65 years and older from 2014 to 2017.

Methods

Multivariate logistic regression was used to obtain marginal effects (ME) describing the association between patient-level characteristics and the likelihood of vaccination. Vaccines routinely recommended by the Advisory Committee on Immunization Practices—seasonal influenza, 23-valent pneumococcal polysaccharide, and quadrivalent inactivated influenza—were examined by age, sex, race, use of preventive s
